Multidirectional Lexical Borrowings in the Ancient Near East in the 2nd Millennium BC

By Marianna Pozza*
Valentina Gasbarra†

This paper investigates how Mycenaean Greek and Hittite languages can be analyzed in the light of the new acquisitions of historical sociolinguistics. In absence of living informants, the study of contact phenomena, which sheds light on a broader extra-linguistic scenario, could be an effective approach in a micro-sociolinguistic perspective. Particularly, the potential role played by Hittite as an intermediary between Akkadian and Mycenaean Greek will be analyzed. Interference phenomena seem to occur on two levels: on the one hand, there are lexemes directly borrowed from Hittite into Mycenaean while, on the other hand, we have found terms of a Semitic derivation where Hittite acts as an intermediary.

Methodological Framework

In the last few decades, the debate on the methodological, theoretical and practical implications of the complex relationship between language and society has been a major focus of linguistic research. This has spawned a number of important studies1 aiming not only to define the exact position of sociolinguistics among language sciences but also to identify its purpose, its areas of interest and the issues to be investigated.

The scope of sociolinguistic studies is the speaker who uses the language within a specific social and linguistic context. Problems arise when we try to apply these concepts and methods to the ancient world2 and specifically to languages attested only through the mediation of writing3.

The use of sociolinguistic perspectives to explain languages of the past (whose attestation is often fragmentary and/or epigraphical) is virtually devoid of the possibility to engage in practical analysis. This consequently narrows the scope of the discipline as it makes it impossible or, at best, extremely hard to use a synchronic theoretical framework, where the evaluative attitude of the speaker and the socio-pragmatic context are fundamental4.

1Among the wide bibliography, it is worth mentioning some recent and useful surveys: Coulmas (1997); Ammon et al. (2006); Wardhaugh (2006); Mesthrie (2011).
4See Mancini (2012).
Labov’s *uniformitarian principle*\(^1\) has inspired a proliferation of methodological reflections regarding the relationship between sociolinguistics and historical linguistics. This has led to the establishment of a new disciplinary field, “historical sociolinguistics”\(^2\), sometimes referred to as “socio-historical linguistics”\(^3\), the combined nature of which is located at the intersection of several disciplines such as linguistics, social sciences, and history.

From a sociolinguistic perspective, in relation to some irregular phonetic patterns of the Greek language, Brixhe (1979: 238-239) pointed out that unfortunately we know ancient languages only through the metalanguage of writing and we are therefore unable to know the real language community and its social structure.

Winter (1999) also emphasized the difficulty of making valid sociolinguistic arguments where extra-textual (i.e. extra-linguistic) data are scarcely available or absent. For this reason, he stated that ‘conjectures one chooses to make tend to remain mere guesswork’ (ivi: 75). In this regard, sociolinguistic analysis strongly depends on the accessibility to a continuum of both linguistic and extra-linguistic information. If this is not the case, as in Labov’s “invisible time”\(^4\), we are faced with an imperfect framework, which can only be reconstructed through assumptions.

Even where it is possible to extend notions and terminology of modern sociolinguistics to ancient languages, their written nature – meaning pre-selective and strongly normalized documentary material – is a factor that could thwart the success of scientific research\(^5\). Epigraphical data, which are generally more relevant from a sociolinguistic point of view, must also be treated with caution\(^6\).

Nonetheless, the sociolinguistic material inferable from *corpus* languages\(^7\), languages\(^7\), for which, as mentioned above, knowledge of the historical and social context is inevitably incomplete, may highlight some micro-phenomena which could serve to decode textual events and evaluate the direction of a change.

For this purpose, this paper shall analyze interference phenomena inferred from the documentary data in the Aegean-Anatolian area from a sociolinguistic point of view\(^8\).

---

\(^1\)See particularly Labov (1975).

\(^2\)Useful surveys on historical sociolinguistics are found in (e.g.) Conde-Silvestre (2007); Hernandez-Campoy and Conde-Silvestre (2012).

\(^3\)The definition of “Socio-Historical Linguistics” is essentially due to Romaine (1982).

\(^5\)For some remarkable examples, see Mancini (2006; 2012).

\(^6\)See the general remarks in Mancini (2012).

\(^7\)The definition of “*corpus* languages” instead of “classical languages”, “dead languages” or “ancient languages” is adopted by Langslow (2002: 23-24) in order to avoid associations with the phenomenon of language death.

\(^8\)A common pottery style of the Aegean-Anatolian Interface seems to be confirmed by archaeological studies (Cf. among others Mountjoy, 1998).
Linguistic Interference as an Instrument of Sociolinguistic Inquiry in Ancient Times

Within sociolinguistic studies, an important distinction is made between macro- and micro-sociolinguistics. Macro-sociolinguistics deals with the analysis of systems within a community of speakers (i.e. the whole community and its varieties of code) whereas micro-sociolinguistics, on the contrary, focuses on individual events of communicative interaction, which is also referred to as ‘face-to-face interaction’ (the reference scale is represented by the communicative event and by speakers’ verbal productions).

The boundaries of this distinction, however, can sometimes be blurred as it is also possible to identify some common subcategories. Fasold (1984; 1990), for example, suggested that when macro-sociolinguistics is framed within a sociological perspective, it tends to cover more general topics such as multilingualism as well as incorporating some micro-sociolinguistic phenomena such as the so-called “language attitudes”. Conversely, micro-sociolinguistics stricto sensu tends to be connected with interactional dynamics (which include, for example, speech acts, ethnography of communication, but also some phenomena that, according to the interpretative approach, may pertain to both categories).

More generally, according to Coulmas’s interpretation (1997: 2), ‘micro-sociolinguistics investigates how social structure influences the way people talk and how language varieties and patterns of use correlate with social attributes such as class, sex, and age. Macro-sociolinguistics, on the other hand, studies what societies do with their languages […]’.

The inclusion of data from the Aegean-Anatolian documentation within this theoretical framework requires further elaboration: firstly, the reference scale, which is a common feature of all corpus languages, is not given by a community of “speakers” but by a community of “writers”; secondly, as pointed out above, what we know about the connection between social structure and real linguistic community is the result of reconstruction.

Data concerning the Aegean-Anatolian area have revealed the existence of some lexical loanwords resulting from language interference. These loanwords, in the light of what has been observed so far, should be placed within a micro-sociolinguistic frame as a result of “face to face interaction”, where the writer records a phenomenon whose occurrence has been already attested by the community of speakers.

Due to the fragmentary nature and scarce usability of ancient languages for proper sociolinguistic inquiry, it should also be emphasised that, although recent handbooks deal with historical sociolinguistics, none of them deals with corpus languages, confirming the inadequacy of available data and achievable results.

---

2 See Ammon et al. (2006: 2).
The application of modern sociolinguistics criteria to ancient languages is at best problematic (cf. for example the interpretation of diastratic and stylistic varieties, considerably constrained and filtered by writing), this paper focuses attention on Aegean-Anatolian contact phenomena, which could be explained through the use of a sociolinguistic interpretative framework. The multilingualism of many ancient societies could be better understood if analyzed from a sociolinguistic point of view, even in absence of a clear extralinguistic context.

Another problem when dealing with genetically related languages attested in the 2nd millennium BC is to evaluate whether terms believed to be contact-induced could be classified as loanwords or whether, on the contrary, they could be an indication of a common isogloss, thus showing some cognate elements.

In the first case, i.e. in the case of loanwords, we are dealing with an “externally motivated change”, whose reasons must be sought in elements which are “external” to the language taken into examination. Moreover, when dealing with such ancient languages, it is not easy to assess the type of interference phenomena with certainty and thus identify convergence or divergence, as the case may be.

Finally, in the case of some of the languages on which this paper focuses, Mycenaean Greek, Anatolian and Akkadian, the fragmented nature of the documentation is very often associated with a limited typology of texts, which restricts sociolinguistic analysis even more. To sum up, then, even if traditional sociolinguistic categories are potentially applicable in diachrony to ancient languages, the achieved results have to take into account a wide range of restrictions imposed by the field of investigation and, as a consequence, they should be accepted as largely hypothetical assumptions.

Micro-sociolinguistic Phenomena in the Aegean-Anatolian Area: Some Case Studies

Direct Loanwords in Hittite and in Mycenaean Greek

In the reproduction of a “foreign” term we can recognize the more advanced outcome of a contact situation. This can happen out of necessity, for example in a changed cultural context, but also for reasons due to the prestige of an interfering language: these are the two key points addressed by Bloomfield’s distinction between “cultural borrowings” and “prestige borrowings”.

---

1 As it is known, the bibliography about linguistic contact and interference phenomena is huge; we only mention here Weinreich (1953); Gusmani (1981); Thomason and Kaufman (1988).
2 See also Schendl (2012: 530 ff.).
5 See Bloomfield (1933: 458 ff.).
Interference phenomena are always associated with the concept of bilingualism. However, two languages may interact without necessarily assuming that the speakers or those communities are bilingual; sometimes, there might just be some relationship between different communities, like when, for example, a language is present in a community who speaks a different language.

The existence of loanwords “at distance”, i.e. not directly depending on bilingualism, is also well observed in many modern European languages. This can be easily applied to the Aegean-Anatolian world. Despite some explanatory attempts, there is not any direct evidence of effective bilingualism; however, there is information of some language elements in different directions, where the writer consciously or unconsciously chooses to code-switch.

Within a typology of documentation seen in Hittite and Mycenaean archives, code-switching can be attributed to several items and it can be assumed to relate to the economy and trade.

It is always difficult to separate proper loanwords from wandering words (Kultur- or Wanderwörter). Whether in the presence of loanwords or of Wanderwörter, the micro-sociolinguistic data gathered draw a highly heterogeneous picture, with several languages (not always genetically related) interacting and acting, in turn, as model or borrowing language. This corroborates the impression that all these phenomena attested for in written documentation are the direct consequence of a face to face interaction realised by speakers.

The presence of direct loanwords is widely attested for; also, it should be pointed out that Hittite and Akkadian can either be the model or the borrowing language. In the first typology (e.g. Hittite as a model language), the following examples can be listed: Hitt. arkamma(n) ‘tribute’ and upati- ‘landed property, concession’, from which Akkad. argamannu ‘purple’ and ubadinnu, the name of a landed concession donated to the king dignitaries. In the second typology (e.g. Akkadian as a model language), we can include examples like Hitt. LÚ apiši ‘exorcist, enchanter (Babilonian)’, Hitt. LÚ kumra- (designation of a religious officer), Hitt. ḫalzi- ‘fortress’, Hitt. zuppari- ‘torch’ for which the Akkadian correspondent, ašipu(m), kumru(m), ḫalšu(m) and tiparu(m) respectively, represents the model word. The category of direct loanwords includes also terms with uncertain etymology and/or meaning: Hitt. magareš ‘coppery things’, probably a loanword from Akkad. magarru ‘wheel’; the adverb pabilili ‘in Babylonian, in Akkadian’, a loanword from Akkad.

1See Weinreich (2011: 53).
2For the theory about the presence of Anatolian scribes acting as “interpreters” in Mycenaean palaces, see Bryce (1999; 2003b: 76-77) and the relevant bibliography.
3In Langslow’s work (2002), see the reference to Fishman, Cooper and Ma (1971), who identify in the following 5 items the motivation of the code-switching: “family, friendship, religion, employment and education”.
4For further remarks about Greek-Anatolian interference phenomena during the 2nd millennium BC, see Gasbarra and Pozza (2012); for those between Akkadian and Hittite, see Dardano (2011).
bābi u ‘Babylon’; lastly, (TÚG/GAD) lupan(n)i-luwan-i ‘headgear, hairband, diadem’, (sword)-knob’, maybe from Akkad. (TÚG/GAD) lubāru ‘linen garment’.

As discussed before, more difficulties arise when evaluating wandering words, due to their ambiguous etymology and to the lack of the original word. Within this category, we can include terms like Hitt. kipriti- ‘a kind of bird’ or ‘a kind of mineral’, probably connected with Akkad. kibru- ‘riverbank’ (with a reference to the sulphurous waters of the river Tigris) as well as a wide range of names of minerals, materials and plants: Hitt. nīri- ‘bicarbonate’ from Akkad. nī(i)ru id.; Hitt. zapzagi- ‘glass’, from Akkad. zabzaghū ‘(a kind of) glaze’; Hitt. allantaru- ‘wood of allānu’, ‘oak’, probably from Akkad. allānu(m) ‘oak’ (?); Hitt. kappani- ‘cumin’ (see Mycenaean ku-mi-no, Gr. κύμινον), a clear derivation from Akkad. kamūnu(m) or kamannu(m), as well as šapšama- ‘sesame’, from Akkad. šamaššammū(m) id.

There are also terms borrowed from Akkadian through the intermediation of the Hurrian language: Hitt. pū ugarī- ‘alternative, substitute, replacement’ from Akkad. pūhu ‘substitute’; Hitt. api- ‘sacrificial grave’ from Akkad. apu-; Hitt. ḫapuzzi- ‘warehouse’ from Akkad. abūsu ‘storage’; Hitt. (TÚG) adupli- ‘ceremony dress, cloak, belt’ probably from Akkad. utuplu; Hitt. ḫuratti- ‘attention, supervision’ from Akkad. ḫurādu id.; Hitt. makalti-, magalzi-, makanti- ‘farinaceous’, ‘bowl’ from Akkad. mākalti- ‘(wooden) bowl’.

The identification of terms borrowed from Akkadian is also possible for the very limited Mycenaean documentation, for example: ku-mi-no-(a), Gr. κύμινον ‘cumin’, to be comparable with Akkad. kamūnu(m) (Ugaritic and Phoenician kmn, Hebrew kammon) and sa-sa-ma, Gr. σήσαμον ‘sesame’, from Akkad. šamaššammū(m) (Ugaritic and Phoenician ššmn). The name of the aromatic and decorative plant ‘cyperus’ has a more uncertain Semitic origin: Mycenaean ku-pa-ro and Gr. κύπαιρον, whose model could be the Hebrew word koper, however connected with another kind of plant, ‘cyprus’ Gr. κόπρος.

Other examples are Mycenaean terms ki-to ‘tunic’, Gr. χιτών, from Akkad. kitī(m) (Ugaritic and Phoenician ktī, Hebrew kūtonet), borrowed from Sumerian gad, gada ‘linen, linen garment’, and ku-ru-so ‘gold’, Gr. χρυσός, from Akkad. ḫūrāsu(m) (Ugaritic and Phoenician ḫrṣ, Hebrew ḫārṣ).

Finally, the Mycenaean hapax ka-ti can be interpreted, in the light of the context where it appears, with the name of a vase or a jar, connected with Gr. *kāthi (cfr. κηθίς), allotrope of Gr. κάθος. The term ka-ti is generally considered a loanword from the Semitic kd, attested in several dialects, Ugaritic and Phoenician kd, Hebrew kad, and with the same meaning of ‘vase, holder for liquid substance’.

Mediated Loanwords in Hittite and in Mycenaean Greek

---

1For a close examination, see Pozza (2011).
Notoriously\(^1\), one of the most complex and debated issues central to defining the chronological framework of the ancient Near East in the 2\(^{\text{nd}}\) millennium BC is to determine with certainty the migratory movements and the precise geographical location of populations of Anatolia in prehistoric times.

If, for example, one considers the different assumptions about the exact geographical location of Luwian speakers in the 2\(^{\text{nd}}\) millennium BC, the view that the Luwians occupied the South-Western territories\(^2\) of the Anatolian peninsula and that they expanded eastward contrasts with the view according to which the original geographical location of the Luwian populations should be based more towards the East\(^3\).

The exact definition of the Anatolian languages and dialects of the 2\(^{\text{nd}}\) millennium BC is also considered a controversial issue: according to the sociolinguistic approach proposed by Haugen (1966), for example, Luwian should be considered more properly as a dialect and Hittite as a real language. On the contrary, according to the principle of mutual intelligibility\(^4\), which is unfortunately difficult to apply to dead languages, both Hittite and Luwian should be considered as fully-fledged languages. On the one hand, the gradual proliferation of Luwian glosses in more recent Hittite texts seems to suggest a growing Luwian-Hittite bilingualism in the capital Hattuša; on the other, it cannot be excluded that the two languages coexisted in a diglossic relationship, with Hittite representing the high variety and Luwian the low one\(^5\).

In fact, although the term “Hittite” refers to a substantially unitary entity from a political perspective, it does not actually relate to a well defined and equally uniform cultural and linguistic entity. The Hittite language is strongly influenced by substrate and/or adstrate\(^6\) languages such as Hattic, Luwian and Hurrian (an Asian language which played a very important role as a mediator between Akkadian and Hittite). This proves that there was an established multilingual pattern typical of the Anatolian peninsula in the 2\(^{\text{nd}}\) millennium BC.

Still, a great influence was exerted by Akkadian, the official language of diplomacy from which Hittite derives – with some adaptations – its graphic cuneiform system and by Sumerian, which, as well as being the first model for the graphic system of ancient Near Eastern languages, continues to exert its influence and be the object of written compositions even after its death as a spoken language\(^7\), maintaining a crucial ideological function for the formation of the scribal and intellectual identity of that time.

\(^{1}\)Cf. recently Yakubovich (2008), to whom we also refer for a summary of the different opinions about the geographical origin of the Anatolian populations and for its rich bibliography.

\(^{2}\)Among the others, Bryce (2003a).

\(^{3}\)Cf. particularly Yakubovich (2008).

\(^{4}\)Dixon (1997).

\(^{5}\)See in particular van den Hout (2007\(^2\)).

\(^{6}\)Cf. in particular Melchert (2003: 21-22).

\(^{7}\)For the different opinions about the time of the death of Sumerian as a spoken language and its relationship with Akkadian, we refer to the discussion in Woods (2007\(^7\)) and the related references.
Finally, in the geo-linguistic landscape of this area in the 2nd millennium BC, it is important to mention the Mycenaean Greek connexion, which was chronologically contemporary with the Indo-European and non-Indo-European languages of Anatolia and Mesopotamia and geographically adjacent to the Western shores of the Anatolian peninsula.

The areal contiguity between the languages under scrutiny and the mutual trade and cultural exchanges should be considered as a favourable basis for linguistic interference: therefore, the relative homogeneity of the cultural and archaeological facies of the Aegean-Anatolian area would not seem necessarily due to the existence of a common cultural and ethnic background, although both linguistic interference and a common substrate are not necessarily irreconcilable.

All these factors, only briefly discussed here, could help to identify a potentially optimal sociolinguistic field of investigation, if only we did not have to deal with the difficulties of corpus languages.

Apart from cases of interference occurring in individual speech acts (which, in the cases discussed here, are only conceivable as ongoing phenomena), it is a well known fact that the place of contact is represented by the same individuals who use the language. It is also equally true that, if we actually want to speak of a real contact, linguistic innovation has to spread from the single speaker to the community out of necessity or due to the prestige of the terms offered by the model language, as shown in the examples below.

As noted above (see § 3.1), for example, in Mycenaean Greek many words of Semitic origin are documented, reflecting the importance that the model language, i.e. Akkadian, had in the 2nd millennium BC. Some of these words, sometimes interpreted as Wanderwörter, seem to have undergone the intermediation of Hittite, which appears to have played the role of “bridging language” between a non-Indo-European language such as Akkadian and an Indo-European language such as Mycenaean Greek.

It is useful to mention, for instance, the Mycenaean words ku-wa-no ‘lapis lazuli’ (cf. Hitt. ku(wa)ma(n) and Akkad. uqni(m)), ku-pe-ra ‘(a type of) pot’ (cf. Hitt. kukupalla, Akkad. kukubu) and e-re-pa ‘ivory’ (cf. Hitt. lahpa-, Akkad. alpu(m) ‘ox’), whose formal structure reflects, according to what has been suggested elsewhere, the mediating role played by Hittite.

Similarly, in the Hittite language, it is possible to find cases of Akkadian loans which, in their turn, are modelled on foreign words, especially Sumerian: Akkadian seems to have been the intermediary between Sumerian and Hittite; see, for example, Akkad. lahan- ‘drinking cup’ with respect to the likely Sumerian pattern DUG.lahan ‘bottle, container used in rituals’ and the Hittite counterpart lahan- ‘bottle’ (where, as usual, it is also possible to recognize a Hurrian intermediation); Hitt. kirinni- ‘precious stone’, from Akkad. girinu,

2For an overview of the linguistic contacts between 2nd and 1st millennium BC in the framework of multilingual Anatolia, see the essays in Cotticelli Kurras et al. (2012).
3For further details concerning also Greek-Anatolian contacts during the 1st millennium BC, cf. Gasbarra and Pozza (2012; 2013).
borrowed from Sum. girin; Hitt. ummiyanni - ‘(name of a) priest’, from Akkad. ummeānu-, borrowed from Sum. ummea; Hitt. LÚšankunni - ‘priest’, through Hurrian intermediation, from Akkad. šangû(m) id., in turn likely to have been borrowed from Sum. sanga; Hitt. tuppi- ‘clay tablet’, again via Hurrian, from Akkad. tuppu(m)/tupp(m) ‘clay tablet, letter, document’, which in turn was borrowed from Sum. dub id.

We shall not dwell on the subject, as the formal reasons why it would be possible to imagine such a process have already been described and discussed elsewhere. The review presented above, however, clearly shows that Akkadian, because of its wide official and diplomatic use and its role as an “international” language, could well represent the linguistic medium through which Sumerian words became part of the Hittite lexicon. Sumerian and Akkadian speakers, in fact, coexisted for centuries in the area south of Babylon. This, of course, in addition to promoting a significant impact on each of the two languages, generated a growing bilingualism among Sumerian speakers, especially during the Third Dynasty of Ur.

Conclusions

This work aims at evaluating interference phenomena (both Kultur- or Wanderwörter and lexical borrowings with their relative adaptation phenomena) in the Aegean-Anatolian area during the 2nd millennium BC as sociolinguistic items, with special reference to micro-sociolinguistics.

The results emerged from a close examination of data, with all the necessary caution that this type of documents implies, have made it possible to identify a set of multidirectional lexical borrowing patterns within the framework of the ancient Near East and its cultural and linguistic melting pot. Thanks to the sociolinguistic perspective adopted in this work, data have been classified using chronotopic variables, which, if well defined – as recently shown by Silvestri (2013) – can help trace the routes of the borrowing procedure.

In our opinion, when dealing with ancient languages like Hittite or Mycenaean and, generally speaking, with languages whose extra-linguistic context is almost unknown, the primary focus must be on contact-induced change. This is, we believe, the only reasonable sociolinguistic approach that can be used to shed light on the migration of words whose success has already been decreed by the community of speakers.
