Preface

This book includes the abstracts of all the papers presented at the 20th Annual International Conference on Marketing (27-30 June 2022), organized by the Athens Institute for Education and Research (ATINER).

A full conference program can be found before the relevant abstracts. In accordance with ATINER’s Publication Policy, the papers presented during this conference will be considered for inclusion in one of ATINER’s many publications only after a blind peer review process.

The purpose of this abstract book is to provide members of ATINER and other academics around the world with a resource through which they can discover colleagues and additional research relevant to their own work. This purpose is in congruence with the overall mission of the association. ATINER was established in 1995 as an independent academic organization with the mission to become a forum where academics and researchers from all over the world can meet to exchange ideas on their research and consider the future developments of their fields of study.

To facilitate the communication, a new references section includes all the abstract books published as part of this conference (Table 1). I invite the readers to access these abstract books – these are available for free – and compare how the themes of the conference have evolved over the years. According to ATINER’s mission, the presenters in these conferences are coming from many different countries, presenting various topics.

It is our hope that through ATINER’s conferences and publications, Athens will become a place where academics and researchers from all over the world can regularly meet to discuss the developments of their disciplines and present their work. Since 1995, ATINER has organized more than 400 international conferences and has published over 200 books. Academically, the institute is organized into 6 divisions and 37 units. Each unit organizes at least one annual conference and undertakes various small and large research projects.

For each of these events, the involvement of multiple parties is crucial. I would like to thank all the participants, the members of the organizing and academic committees, and most importantly the administration staff of ATINER for putting this symposium and its subsequent publications together. Specific individuals are listed after the Editors’ Note.

Gregory T. Papanikos
President
Editors’ Note

These abstracts provide a vital means to the dissemination of scholarly inquiry in the field of Marketing. The breadth and depth of research approaches and topics represented in this book underscores the diversity of the conference.

ATINER’s mission is to bring together academics from all corners of the world in order to engage with each other, brainstorm, exchange ideas, be inspired by one another, and once they are back in their institutions and countries to implement what they have acquired. The 20th Annual International Conference on Marketing accomplished this goal by bringing together academics and scholars from 27 different countries (Algeria, Austria, Botswana, Canada, China, Colombia, Croatia, Egypt, Finland, France, Germany, Hong Kong, Hungary, Israel, Italy, Lebanon, Morocco, Norway, Portugal, Russia, Serbia, South Africa, South Korea, Spain, Taiwan, Tunisia, and USA), which brought in the conference the perspectives of many different country approaches and realities in the field.

Publishing this book can help that spirit of engaged scholarship continue into the future. With our joint efforts, the next editions of this conference will be even better. We hope that this abstract book as a whole will be both of interest and of value to the reading audience.

Cleopatra Veloutsou & Olga Gkounta
Editors
20th Annual International Conference on Marketing, 27-30 June 2022, Athens, Greece

Organizing & Scientific Committee

All ATINER’s conferences are organized by the Academic Council. This conference has been organized with the assistance of the following academic members of ATINER, who contributed by reviewing the submitted abstracts and papers.

1. Gregory T. Papanikos, President, ATINER & Honorary Professor, University of Stirling, U.K.
2. Cleopatra Veloutsou, Head, Marketing Unit, ATINER & Professor of Brand Management, University of Glasgow, UK.
3. Chris Sakellariou, Vice President of Finance, ATINER & Associate Professor of Economics, Nanyang Technological University, Singapore.
4. Henry Thompson, Head, Economics Unit, ATINER & Emeritus Professor, Auburn University, USA.
5. Sharon Claire Bolton, Vice President of Research, ATINER & Emeritus Professor, The Management School, University of Stirling, Scotland.
6. Peter Koveos, Head, Finance Unit, ATINER & Professor of Finance, Syracuse University, USA.
7. Mert Uydaci, Professor, Marmara University, Turkey.
8. George Priovolos, Director, Center for Small and Medium-Sized Enterprises (CSME) & Retired Professor, USA.
9. Angelos Tsaklanganos, Academic Member, ATINER & Emeritus Professor, Aristotle University of Thessaloniki, Greece.
FINAL CONFERENCE PROGRAM

20th Annual International Conference on Marketing, 27-30 June 2022, Athens, Greece

Old and New-An Educational Urban Walk

The urban walk ticket is not included as part of your registration fee. It includes transportation costs and the cost to enter the Parthenon and the other monuments on the Acropolis Hill. The urban walk tour includes the broader area of Athens. Among other sites, it includes: Zappion, Syntagma Square, Temple of Olympian Zeus, Ancient Roman Agora and on Acropolis Hill: the Propylaia, the Temple of Athena Nike, the Erechtheion, and the Parthenon. The program of the tour may be adjusted, if there is a need beyond our control. This is a private event organized by ATINER exclusively for the conference participants. Some participants have videotaped the event. Click here for an example.
Title: Marketing Skills in High Demand: Exploratory Study of Competencies for a Marketing Professional.

3. Fatima Ez-zahra Moustaid, PhD Student, Cadi Ayyad University, Morocco.
Title: Transformation of the Transportation Sector: The Emergence of Intermediaries in Digital Services Related to Transportation.

13:00-14:30 TIME SLOT 7 – NOON PRESENTATIONS

Coordinator: Adel Sakr, Lecturer, Webster University - Greek Campus, USA.
1. Ravit Rubinstein-Levi, Lecturer, Ben-Gurion University of the Negev, Israel.
Title: Financial and Social Implications of DC Pension Funds Aggregation.
Title: Measuring the Level of Technology in Moral Economics.
3. Amévi Patrice Alowou, PhD Student, University of Burgundy, France.

How Can Megaprojects be Environmentally Friendly? Case Studies on Some Ongoing Megaprojects in Egypt

Megaprojects are becoming the preferred model for delivering goods and services across a range of businesses and sectors. With the increasing interest in environmental issues and sustainable development, many countries seek to improve the investment climate without leading to the decay of the environment as a result of the growing economic activity. The aim of the paper is to assess the potential social, economic and environmental impacts of megaprojects. Three ongoing megaprojects in Egypt are analysed in this paper, namely: Suez Canal Economic Zone, El Dabaa Nuclear Power Plant, and Jabel El Zeit Wind Station. During the construction period, Egypt will witness huge changes in many fields. The young majority of the local workforce of the country will be employed. Huge investments will also be placed in the housing sector and infrastructure especially in transportation roads, railway networks, and in the electricity grid.
Amèvi Patrice Alowou

Forgone of Student Care in Togo: State of Play and Analysis of the Determinants of Forgone of Care Based on an Ad-Hoc Survey on the Campus of the University of Lomé

Brief Presentation of the Problem and its Stakes

Of the 1.8 billion young people in the world, 90% live in developing countries \(^1\) (UNFPA, 2014). Projections (United Nations, 2019a) predict a 62% growth in this population by 2050 in the 47 least developed countries (including Togo). In Togo, young people represent 19.6% of the population in 2019 (United Nations, 2019b).

There are more than 1.5 million young people aged 10 to 24 who have died, or nearly 5,000 per day worldwide (WHO, 2021). The global average probability that a 10-year-old will die before the age of 24 is six times higher in sub-Saharan Africa than in the rest of the world (WHO, 2021). These figures are explained by the failure of health systems and/or the absence of policies specifically targeting this population (United Nations, 2019a).

Yet young people – and especially students – represent a major challenge for developing countries, particularly in the perspective of the Sustainable Development Goals. They will be the workers and parents of tomorrow in particularly fragile economies. Access to and equity in health care for young people is therefore a challenge for several countries in sub-Saharan Africa (Boltena et al., 2012).

Based on an ad-hoc survey, we seek to better understand the state of health, health needs, access and use of care of students at the University of Lomé. More specifically, it will be a question of highlighting the behaviors of forgone of care. To this end, we will seek to identify to what extent Togolese students give up health care, what types of care

---

\(^1\) Persons aged 15 to 24 as defined by the United Nations.
are concerned, for what reasons and what factors may explain the forgone of care for financial reasons.

*Originality of the Communication by Situating it in the Existing Literature*

The reasons for renouncing care are diverse. Desprès (2012) distinguishes between barrier renunciation and renunciation-refusal. Barrier renunciation refers to the factors that can hinder access to health care, including informational, geographic, organizational barriers, but also financial barriers. Forgone-refusal refers to a desire of the individual not to seek care. If, thanks to the questionnaire we have developed, we will seek to characterize these different forms of forgone of care, particular emphasis will be placed on the forgone of care for financial reasons. Indeed, we know that financial barriers are one of the main obstacles to the use of care, particularly in developing countries where health financing is mainly based on direct payments; however, students are generally in precarious economic situations.

In Togo, there is very little health policy in favour of young people. In 2007, Togo’s National Youth Policy for 2007-2011 was signed. This policy was intended to contribute to improving the state of health of teenagers and young Togolese but it has not been renewed.

In fact, we know very little about this student population: their state of health, their health needs, their health behaviours and recourse to care, their relationship to prevention, tobacco, alcohol consumption, their living conditions.

Indeed, to our knowledge, there are no studies specific to Togo to measure these phenomena. However, some data on the economic situation of students are available and suggest the value of collecting data on student health. For example, the poverty report presented by INSEED-TOGO showed that the incidence of poverty is 45.5% at the national level in Togo. Another report presented by the International Labour Office showed that a large proportion of young students face economic difficulties 2 (Koné et K.S, 2013). Some students from disadvantaged strata are forced to do poorly paid activities. This precariousness is felt more among young female students. These results are found in other countries, not only developing but situations of economic precariousness combined with weak financial protection against disease risk can exacerbate the problems of giving up care in countries such as Togo.

---

2National Institute of Statistics and Economic and Demographic Studies of Togo. Available at https://inseed.tg/. Accessed 21/05/2021
In sub-Saharan Africa, studies have been conducted in some countries to identify unmet care needs and barriers to accessing care among students. Boltena et al., (2012) conducted a survey of students on the campus of the University of Uganda in 2005. The objective was to identify unmet health care needs as well as barriers to students’ access to care. The results showed that two out of five students reported giving up medical care and one in five students reported unmet sexual health needs (Boltena et al., 2012). The acceptability, availability and accessibility of health services were the main barriers to access to care that students said they faced (Boltena et al., 2012).

Another study was conducted in Côte d’Ivoire among students by Inghels et al., (2017). The results showed that the main barriers to accessing care were the perception of the high cost of these services and the lack of information. The main health problems reported by young students were malaria (54.3%), respiratory infections (44.6%), constipation problems (28.0%) and psychological disorders (25.9%) (Inghels et al., 2017).

This study will be the first to our knowledge in Togo. In addition, this paper will contribute to enriching existing – but few – works on students’ health and their use of carebehaviours.

Methodological Approach Adopted: Source and Tools

The data come from an ad-hoc survey of students at the University of Lomé. The survey will be administered online, via the Lime Survey software. The questionnaire aims to collect information on: the living conditions of students, their lifestyle habits, their health behaviours and use of care, their state of health and health coverage.

A first statistical exploitation will make it possible to draw up a portrait of the students of the University of Lomé and then to characterize more particularly the renunciation of care. We will then study more precisely the renunciation of care for financial reasons via an econometric analysis.

Using a nested logit, we will estimate the factors that influence the likelihood of having given up care for financial reasons the last time respondents felt a need to consult. The factors we will retain come from the literature and we will rely in particular on the model of Andersen, (1995) who distinguishes between predisposing factors, facilitating factors and factors of need. We will use as explanatory variables: age, sex, insurance coverage, subjective state of health, level of diploma, level of education of parents, financial situation.
Economics and Science in the Age of Fear

Far right and populist political movements are rampant in many countries – brewing on uncertainty and fear in the light of the pandemic and the environmental breakdown – affecting not only the governance of democratic regimes but also the science-policy relationship, the global environmental agenda as well as the pandemic public-health related agenda. In this paper, we disentangle the roots of such ‘far right and populist insurgency’ and discuss the implications for science and, in particular, for economics as a field. Both environmental policy and post-pandemic policy are rooted in approaches that stem from a vision of the scientific discourse as the dominant one. And yet, various forms of denials have come to the surface in recent times, questioning the relevance and authority of the scientific discourse. Post-truth arguments have been used to address this attitude.

It appears that to be able to understand and address this phenomenon, scientists, economists and policy makers should devote attention to analyze how the evolution of value systems (including health and environmental values) is related to the profile and governance of contemporary global capitalism. Populist nationalism has given way to new geographies of exclusion, interpreting the community of citizens in narrow, exclusionary terms, justifying the expulsion of ‘aliens’ from narrow space and the designation of certain citizens as foreign to the body politic.

The philosophical foundations of what used to be called “the scientific method” – and is nowadays simply known as the scientific attitude – have led as scientists to finally accept that approximate truths are perfectly adequate, and that “absolute truth” is an illusion. In popular culture, a new irrational sociological phenomenon called Post-Truth conveyed by social media, the Internet and fake news has developed in the Western world convincing millions of people that truth simply does not exist. In addition, the policies that have addressed the pandemic have been questioned at their roots, causing a philosophical “pandemonium”. The current COVID-19 health crisis is highlighting views and highlights that parallel the environmental crisis, as the pandemic produced a significant environmental jolt that has altered the trajectories of economies and institutions (with high inequalities stemming from its syndemic nature). In this paper, we review all of the above issues, trying to make sense of a global
uncertainty in the scientific discourse and the way it addresses alternative views and policy propositions.

Changing Times and Expectations in Higher Education:  
How Faculty Can Optimize Their Time and Effort

There are multiple factors driving the higher education industry, and instructors are required to take on more and more responsibilities. Therefore, making our work more effective and efficient will allow us to continue to be competent instructors. In this paper, we present a method of examining our different activities, both logically and using operations methods. The logic is something that many use, even if unknowingly, but the operations methods suggest that there are ways to quantify the effect of time versus outcomes. Along with this, we have to consider that activities that worked in face to face classes might not work in virtual classrooms – Zoom or totally online. Our research is a call for design thinking in how we organize our class activities for effective and efficient outcomes for both students and instructors.
Factors Determining Successful Business-to-Business Salesforce Transition to Adapt to Changing Customer Needs

As a result of disruptive technologies being launched in the marketplace, customers have changing expectations from organisations. It is important to understand how these changing expectations are being met, particularly in business-to-business (B2B) sales organisations. Therefore, the purpose of this study was to focus on how B2B company salesforces are responding to customer and market pressures for better service and greater relationships. The objectives of the study were: (1) to identify the changes in customer expectations, (b) to determine the current challenges faced by the B2B sales organisation, and (c) to investigate the extent to which these changes and challenges are addressed. The literature review of these objectives identified six determinants for B2B salesforce transition that were tested in the research.

The study followed a mixed method approach whereby qualitative and quantitative research methods were employed, using purposive sampling. For the qualitative study, data was collected through personal interviews from a purposive sample of 6 respondents, which was content analysed to identify themes. For the quantitative study, an online survey was administered using a structured questionnaire on a convenience sample, and the data was analysed using Principal Components Analysis. The study identifies the emergence of new pressures and mandates which are changing management thinking about the “front-end” of organizations, and moving companies towards a change in the role of sales, account management and marketing. The analysis identified six factors critical to successful transition: Changed role of salespeople, Customer focussed strategy, New sales skills, New sales metrics, New operating model, and Internal development interventions.

It was found that the 4th Industrial Revolution (4IR) is heavily knowledge-based and requires new competencies for sales organisations to be successful, as well as new ways of doing business,
including strategic and operational changes to address the customer requirements.

The study provides a framework to implement the key requirements that have been identified for sales organisations to be successful in the era of change:

a) the development and implementation of an enterprise-wide customer strategy that is integrated into the overall business strategy of the company,
b) the establishment of new relevant sales metrics/performance measures aligned to the new strategy,
c) the provision of sales enablement with respect to both operations and technology, and
d) the building of strong customer relationships through focussed key account management principles and tools.

Business Models for Sustainability:  
The Case of the Fashion Industry  

Sustainable fashion is currently at an important crossroads due to its huge impact on local communities and people’s buying behaviours. Although the fashion industry operates in a highly competitive market dominated by global brands, it faces impressive social and ecological challenges because it has a huge climate change footprint, and if global consumers are demanding to tackle the existential threat of climate change, the fashion industry needs to urgently address its unsustainable practices, which is considered one of the largest polluting industries in the world. To address effectively these challenges, we need to undertake collective actions from different stakeholders, including individuals (or consumers), firms, suppliers, and governmental actors. We are increasingly experiencing emerging peer pressure, governmental initiatives, and consumer demands that are forcing firms to address ecological and social concerns in their business activities. Ultimately, fashion firms have to manage an important trade-off. On one hand, they should be profitable and offer economic value, on the other hand, they should be social and environmental oriented. Another topic that is addressed in the present study relates to the new Generation Z, which is a group of consumers that were born in 1995, and that are more tech-savvy and more green-oriented. In designing their products and promoting their brands, fashion firms should be aware of these groups of consumer’s preferences and expectations. This study holds that to address effectively these concerns, fashion firms need to design appropriate business models (BM). A BM portrays the content, structure, and governance of transactions designed to create value through the exploitation and exploration of business opportunities (Amit and Zott, 2001, p. 511). The business model design is basically an abstract representation of the value flow, that comprises value creation, value capture, and value delivery. The link and functioning of these types of value are essential to the success of the firm. In light of the above considerations, this study contributes to advance knowledge on a sustainable BM in the fashion industry by addressing the following research questions:
1) How a sustainable business model within the fashion sector contributes to value creation, value capture, and value delivery?
2) How do fashion firms address generation Z?

Traditional Justice System versus Mediation, from the Perspective of the Economic Analysis of Law

Following a brief presentation of the current European and Spanish institutional framework in which each question unfolds, and employing the methodology of the Economic Analysis of Law that is clearly appropriate for the interdisciplinary study of these matters, starting from the pioneering contributions from R. Coase, I assess the main elements of the traditional justice system and some of the now so-called alternative dispute resolution systems (ADR), which may be employed, where it calls to do so, for the reform of their design and which, in short-medium term, constitutes a question that has now acquired a renewed interest following the entry into force of the new European framework of alternative resolution, and in line with consumer litigation.

The undertaking of the economic analysis of both systems is articulated in two fundamental concepts of the Economic Analysis of Law, these being the efficiency and equity both of the ordinary Judicial System and the ADRs, notwithstanding, of course, others such as transparency, legal certainty, etc.

In recent decades a number of private and public institutions have been drawing attention to deficiencies presented by the Judicial Administration in Spain, and in the same vein have been raising proposals of reform, although from an overall and scientific-technical viewpoint alternative dispute resolution (ADR) systems cannot be considered as competitors in the sense of alternatives to the ordinary judicial system.

In truth, they represent two ways of resolving social conflicts, of doing justice, but in those where the observance of citizens’ legal guarantees should be reserved for the judicial system. To this end, ADR systems are not competing mechanisms in terms of being exclusive or alternative, rather, they are complementary, opening the possibility of companies and consumers using extrajudicial channels that are more agile and cost-effective when compared to the ordinary judicial process, in order to put an end to their litigations and claims.

The pioneering contributions of Coase, collected today by the Economic Analysis of Law and applied to the Legal System as a general approach, posits that a conflict can be resolved based on criteria of efficiency and equity, following the setting of property rights, via a
simple direct negotiation between the affected parties, either with or without the intervention of a third party (referee, mediator, friend, arbitrator, etc.), under the sole condition of the cost of accessing conflict resolution via the intervention of these agents is lower than the cost of the transaction.

Mediation in consumer activities in relation to the traditional justice system presents a series of elements whose employment is recommended, as they are able to collaborate in the improvement and efficiency of the management of justice in Spain and, therefore, to increase the well-being of the majority of the population. We refer, above all, to lower cost, shorter duration, greater transparency and, thus, foreseeability in the resolution of conflicts and, in addition, these advantages will increase with the incorporation of digital platforms in the management of these procedures.
An Empirical Analysis of the Complementarities and Substitutions between Effects of CEO Regulatory Focus and Corporate Governance on Greenwashing

When it was vigorously promoted that companies ought to green management, the cases of greenwashing have gone sharply. The greenwashing of corporate refers that the companies engage in symbolic communication about environmental issues without addressing them substantially in actions, and we wonder the motivation for companies to greenwash. This study explores the antecedent variables that lead to the corporate greenwashing from the individual level and organizational level. At the individual level, we emphasize that CEO regulatory focus, one of the characteristics of executives, will affect the behavior of greenwashing. Meanwhile, at the organizational level, the corporate governance, such as the degree of independence of board of directors and the presence of strategic committee play an important role too. We also examine the interactive effect on greenwashing between CEO regulatory focus and corporate governance, to further study the complementary or the substituted effect. Moreover, in China’s unique institutional context, the influence of market competition on the interactive effect will be taken into consideration. The hypotheses test through the empirical analysis of the panel data of Chinese companies in ASSET4 database from 2010 to 2015, and the CEO regulatory focus is measured through content analysis of annual report and shareholder letters. The results show the substituted relationship of CEO (with high promotion focus and low prevention focus) and high director independence or the existence of strategy committee, otherwise the complementary relationship between these two effects. Additionally, the market competition strengthens the interactive effects. This research provides a theoretical reference for Chinese companies in explaining the motivations for greenwashing and it also gives suggestions for them to reduce the behavior of greenwashing.
Marketing Lebanese Identity through People’s Uprising: Promoting Ethnocentrism and Lebanese Products and Services

For centuries, Lebanon has been affected by a series of colonizations, foreign settlements, illegitimate occupations, oppressions, lack of freedom, internal and external conflicts and a deteriorating economic situation that led to an overwhelming brain drain. Those who departed have excelled and left a very positive impact in various economic, medical, political and social sectors in their countries of immigration. Those who stayed were very eager to leave Lebanon looking for new opportunities outside their country.

Suddenly, in an unprecedented move, Lebanese residing in Lebanon and those who have immigrated are united in a revolution, not along sectarian affiliation, which took hold of the country’s identity for many years, but under a united goal to remove an inefficient, incompetent and corrupted government.

This research work consists of a series of semi-structured interviews focusing on how various individuals view their identity. The sample consists of both Lebanese individuals who immigrated during the last ten years and others still residing in Lebanon. The aim of the research is to study the attitude of Lebanese people towards their identity. A world known Lebanese author referred to this ambiguity by “You have your Lebanon and I have my Lebanon.” (Gibran, 1993).

However, because of the recent revolution, the researchers decided to analyze the attitude of the Lebanese population towards their identity before the uprising which will be called “First Period” (before October 17, 2019) and during/after the uprising which will be called “Second Period”.

The researchers’ objective is to understand this complex social phenomenon and develop a model to market the Lebanese identity in order to achieve a brain drain reversal hoping to boost the loyalty of the scattered diaspora to their homeland so that they can contribute towards the economic stability, intellectual and cultural revival and reconstruction of Lebanon. The researchers hope that this model will be followed by other countries.

**Generalization Analysis of CNNs for Classification on Spheres**

In this talk, we present our recent work to develop some generalization analysis of a deep CNN algorithm for binary classification with data on spheres. An essential property of the classification problem is the lack of continuity or high smoothness of the target function associated with a convex loss function such as the hinge loss. This motivates us to consider the approximation of functions in the $L^p$ space with $1 \leq p \leq 1$. We provide rates of $L^p$-approximation when the approximated function lies in a Sobolev space and then present generalization bounds and learning rates for the excess misclassification error of the deep CNN classification algorithm. Our novel analysis is based on efficient cubature formulae on spheres and other tools from spherical analysis and approximation theory. This is a joint work with Shuo Huang and Ding-Xuan Zhou.

The Impact of Financing Constraints on Cross Border M&As

Cross-border mergers and acquisitions (CBM&As) are a significant component of foreign direct investment, which in turn is at the heart of an international business strategy for an MNE. However, while there is a large theoretical and empirical literature documenting how these strategies are determined and implemented, there is a relative dearth in the literature on the role played by financial constraints, that is, the ability to finance the transaction. What is important is that a CBM&A involves both a scale and an immediacy to raising the financing that a greenfield FDI may lack. We hypothesize that financially constrained firms are inhibited from undertaking CBM&As, due to these two factors of scale and immediacy and further that these constraints are increasingly binding the less developed the financial market where the target firm is located. Evidence in support of these hypotheses is documented using firm-level data on CBM&As from OECD and BRIC countries into every country in the world for which data exists. The implication is that not only are financing constraints important in explaining the extent to which firms undertake CBM&As, but also that these constraints may have a significant impact on where acquiring firms target companies for acquisition.
Measuring the Level of Technology in Moral Economics

This largely theory-based paper attempts classifying and combining methods of orthodox and heterodox economics regarding the measurement of technology levels. The importance of measuring the level of technology is illustrated by technology being a key factor in several neoclassical models (e.g. the production function, total-factor-productivity). However, just as for the concept of utility, traditional economics treats the level of technology as an abstract scientific construct, without attempts for an absolute quantification. This paper argues that through a systematic classification and various methods, starting- and end points, milestones and even units of measuring the level of technology can be determined. After surveying the literature (with special regard to models involving technology levels, empirical methods and applications of technology level measurement, and the theory of innovations) the paper identifies the existing options of measurement, and their shortcomings. Technology is looked at as a “stock”, as opposed to the overrepresented “flow” nature, resulting in the dominance of relative measuring, as opposed to absolute scales and numbers. Contemplating the stock nature gives space for the methods of constructing an absolute scale, and for the unique concept of the “steady-state technology”. As for the classification, distinctions are made between demand-side and supply-side measurement of the level of technology, as well as between historical and geometrical methods of constructing scales. The methods are illustrated, though not fully implemented, due to restrictions in scale and scope. Finally, the paper shows how heterodox economic branches, such as the newly emerging moral economic school, allow for the demand-side measurement to a greater extent, given the adjusted economic axioms. This result, in turn, may lead to a novel viewpoint on future technologies, and to deeper incorporating the human needs aspect into technology’s definition.

Strategic Leadership and Change Management

Change management is undoubtedly one of the major challenges facing companies today. The speed and velocity of environmental transformations are forcing organizations to implement large-scale changes in shorter periods of time. Only those companies that demonstrate a real ability to change will stand out.

Faced with all these organizational changes and the risk of disappearing, organizations must transform, rethink and redefine their structures and strategies. This new objective that organizations are imposing on themselves is far from being incompatible with their primary vocation of producing wealth and seeking profits (Boucher, 1974). In fact, the two objectives go hand in hand.

In order to reach their new objective, organizations must focus on the actor as the determining factor of their transformation. Indeed, it is this intangible dimension, the human dimension, that is the key to the success or failure of organizational change. According to Bareil (2004), "organizational change cannot be achieved without the contribution of individuals. Indeed, they are the ones who will enrich, improve, and give meaning to things so that the changes bring the expected results. This is the role of leadership, among others.

The role of leadership in organizational change is very important. Pluchart (2006, p. 32) defines leadership as "the ability of an individual to influence the behavior of a social group [...] It corresponds to a style of behavior, more or less authoritarian or cooperative, adapted to the constraints of a mission, to the personalities of a group and/or to the values of a socio-professional environment: the leader uses coercion, persuasion, exemplarity, manipulation, etc. in order to steer a group by influencing the behavior of its members. Indeed, the role of the leader in initiating and leading change is decisive, because "nothing is done without a leader".

Through an in-depth and critical analysis of the literature, we will try to determine the central role of the leader and the skills needed to lead a transformation process.
Frédéric Jallat  
Professor, ESCP, France

The purpose of this study is to explore the real nature and peculiarities of dyadic business relationships within the B2B services network context of a developing economy (Awan, 2008; Biggemann & Fam, 2011; Dang & Cliquet, 2012; Dinh & Pickler, 2012; Lee & Dawes, 2005; Liu et al., 2008).

We selected the pharmaceutical distribution sector in Vietnam as our main field of investigation—taking into consideration the complex structure of relationships within the sector, the involving nature of exchanges that have a direct impact on human health, and the cultural dimensions of the service business context (Hekansson et al., 2004; Lee & Dawes, 2005; Liu et al., 2008).

Expectations of retailers (pharmacists) towards their suppliers were investigated in order to identify the main drivers of their satisfaction, and in order to analyze the current nature of buyer-seller relationships in a developing country (Andersen et al., 2008; Churchill & Surprenant, 1982; Parasuraman et al., 1985; Parasuraman et al., 1988; Seiders et al., 2005).
Experience Marketing in Music

The paper presents theoretical and practical aspects of experience marketing in music. The focus of the paper is to point out elements of experience marketing through music, in the way how music creates messages and experience. Goal of the paper is to analyze theoretical and practical aspects of experience marketing in music by experiential tools. The paper will present case studies about music, concerts and festivals. In the paper will be present in-depth interviews with professors of music theory and practice, as well as with musicians. Conclusions of the in-depth interviews will impact on future work on experience marketing in music. In case studies will present impact of music on social movement, raising awareness about social problems and dilemmas, raising awareness about thoughts, ideas, values, that otherwise could be unnoticed. One of the case studies will be present concert of classical and modern music. Special approach will be made on emotional branding of music’s song, events, concert and festivals. Emotions are the key in implementation of strategies of experience marketing, by experiential tools. In in-depth interviews will be analyze impact music on emotions, marketing approach of segmentation of target audience, communications with audience through traditional and modern media. In empirical research will be use questionnaire for audience about experience with music events, about what raise their emotional involving with some songs, musicians, music, lyrics, what emotions connect them with songs. Through theoretical analyze, case studies, in-depth interviews with professors of music and musicians, questionnaire with audience and with qualitative observation, the paper will give conclusion about experience marketing in music.
Pandemics in their nature disrupt every aspect of people’s lives in an unprecedented manner. More so than any prior pandemic, the COVID-19 has overwhelmed many people’s lives, countless of its implications such as loss of jobs, loss of human life has led to a drop in the demand for goods and services, subsequently slowing down business performance and economic growth. The disruptive nature of COVID-19 pandemic puts governments, especially in developing nations, under immense pressure to act decisively and effectively in building better and emerging successfully from this crisis. Building better” and emerging from the crisis with sustainable economic recovery requires an integrated approach, an approach that anticipates further impacts of the pandemic and recovery measures that are inclusive and sustainable. As such, governments all over the world are on a gradual transition that is aimed at stimulating balanced and inclusive economic growth. Prior literature suggests that being an established knowledge-based economy can assist in facilitating economic growth and recovery. Consequently, the aim of this paper is to explore the role of an established knowledge-based economy as the decisive factor in any scenario of emergence from the crisis and economic recovery from the COVID-19 pandemic. In this context, the definition of a knowledge-based economy being used is one that is associated with high technological use, intense and rapid innovations, and a high reliance on knowledge to further the recovery & development of the economy. This paper presents the current state of the economy, educational system, broadband systems, and the investments made into research and development in the context of Botswana. An analysis of the immediate, medium, and long-term effects of the COVID-19 on economic development and elements for an integrated government approach for a fair and inclusive recovery and resilience are critically examined, using empirical data from Botswana. In the conclusion, the paper discusses the major issues that require attention to enable a knowledge-based Botswana.

Association between Temperature and Suicide Attempts:
A Time-Stratified Case-Crossover Analysis

Several epidemiological studies have shown that short-term exposure to high temperature is related to increased mortality. Recent studies have reported that high temperature is not only associated with various human diseases, but also with the risk of emergency room visits and suicide due to mental illness. In Korea, there have been studies exploring the effects of high temperatures on the risk of emergency room visits due to mental illness, and it has been reported that the risk of mental illness increases as temperature increases. However, the data of the National Emergency Department Information System (NEDIS) often show that mental illness is not included in the diagnosis code even though they visited the emergency room in a suicide attempt while having a mental illness. Therefore, this study attempted to confirm the relationship with temperatures in emergency room visitors listed as self-harm and suicide in the NEDIS standard system diagram.

The subjects of the study are patients who visited the emergency room located in Seoul from 2014 to 2018 due to suicide attempts. The minimum, maximum temperature, daily temperature difference, relative humidity, sunshine duration, and cloud cover provided by the Korea Meteorological Administration were used as meteorological factors, and all the factors were converted into percentile values to compare with national meteorological factors. A time-stratified case-crossover design was applied and analyzed using the conditional quasi-Poisson regression model. The lag effect of the temperature percentile was explored using the distributed lag-nonlinear model.

From 2014 to 2018, the number of emergency room visits due to suicide attempts in Seoul was 30,012. With other meteorological factors confounded, the risk of suicide attempts increased significantly as the maximum temperature increased. On the other hand, there was no significant relationship between the minimum temperature. The relative risk at the 90th percentile value of the maximum temperature for suicide attempts at lag 0 was 1.08 (95% CI: 1.03, 1.14) compared to the 1st percentile value. The relative risk was highest at lag 0, and it was significant up to lag 2, but there was no effect after that.
We found that exposure to maximum temperatures over a short period of time increases the risk of emergency room visits due to suicide attempts. These results suggest that the maximum temperature rather than the minimum can be a short-term trigger for suicide attempts.

Senior Lecturer, Ruppin Academic Center, Israel

Exploring the Probabilistic Reasoning in Tasks Involving Uncertainty

This study explores the judgments of participants in probabilistic tasks which require comparing two probabilities either with or without introducing an additional manipulation of uncertainty. The novelty of this research is in exploring the probabilistic reasoning in tasks that involve an additional condition of uncertainty.

According to dual-process theorists two general types of reasoning processes tend to be used in making probabilistic judgments. On the one hand, people use analytic processes. On the other hand, people develop heuristics, intuitive rules for analyzing the probabilities. Inspired by many studies of understanding probability we used tasks of binary comparisons. A typical probabilistic task presents the participants with two containers of white and black balls: Urn A and Urn B. The first task, a comparison of probabilities (CP), asked participants to compare probabilities of randomly drawing a black ball from two different urns. The second task, an additional condition of uncertainty (ACU), asked participants to decide how the probability of randomly drawing a black ball from Urn B would change after transferring a randomly selected ball from Urn A to Urn B. These tasks differ in their content but can be solved analytically in the same way.

The aim of the study was to explore if there is any difference in the accuracy and reaction time of responses between the CP task and the ACU task and to learn about the influence of the probability of transferring a black ball from urn A to Urn B on the responses. The participants were 66 college students (29 males and 37 females) who had previously studied a course in probability. They were presented with computerized tasks. A paired samples t-test, revealed significantly higher accuracy and higher response time in the CP task \((p < .01)\), meaning that heuristics was used in the more difficult ACU task. Regarding the ACU task participants’ responses were affected by the composition of Urn A, regardless of the composition of Urn B. To overcome this bias toward a deterministic thinking, a gradual method was developed that would build better intuition for the students.

Assistant Professor, University of South Carolina, USA

Teaching Two Essential Soft Communication Skills Together: Time Management and Conflict Resolution Training in Undergrad Course

Management training in the soft communication skills of conflict resolution and time management can be taught simultaneously to help increase awareness of both in undergraduate courses. Conflict between humans is unavoidable. Deadlines are necessary. Students involved in real-world style teams for courses will certainly face both.

Assertiveness and Cooperation are on spectrums (active listening versus avoidance); however, team problem solving means first assessing individual perspectives. This means equally hearing less loud, assertive voices. The ability to facilitate dialogue in a calm, intelligent, timely manner is an impressive skill. Aggressive angry responses can easily destroy a team’s cohesion. This means managing big emotions without humiliating anyone through active listening and looking to emphasize understanding.

Time management allows us to accomplish more in less time. Conflict slows that process, but sometimes is beneficial to highlight an aspect requiring more insight. Sometimes, understanding the significant impact of robust time management lessens the need for conflict resolution.

If conflict is unavoidable, the time management training creates a window of opportunity for such talks to improve the situation, making third party time investment unnecessary. If conflict resolution by a third party is unavoidable, time management training can lower the cost of the interaction by shortening the amount of time needed for a successful employee response adjustment.

Both topics of time management and conflict resolution are more helpful presented together in a class with semester long team projects to increase morale, inspire, and motivate of those groups -- and by making both subjects clearer.

An Impact the Losh’s Regional Study for Russian State - Market Economy

An outstanding German economist August Losh was one of the founders of the regional economy. His main methodological idea is a hexagonal spatial pattern for regional economy (Figure 1).

\textbf{Figure 1. Hexagonal Spatial Pattern by A.Losh.}  
\textit{Where. A – Regional Center}

According to Losh the hexagonal spatial pattern is more useful for reduction of the transport costs. That why we may say that it also may be applied for Russian state market economy. It’s possible due to such factor as Russian logistics.

In Russia logistics is more developed in Moscow and St.Petersburg. Logistics began in these two Russian cities in 18th century and now it is also advanced in these cities.

Nevertheless, for objective scientific approach we point out for significant obstacle concerns with the Losh’s spatial pattern for Russia. I speak about strong federalism which negatively impact upon Russian economy and consequently slows its regional economy.
Transformation of the Transportation Sector: The Emergence of Intermediaries in Digital Services Related to Transportation

Seen as a new business model, collaborative consumption is no longer just a marketing trend. It is propelled by the explosion of New Information and Communication Technologies (NICT), and the development of networks.

The ecological awareness, the emergence of social networks from the 2000s, the advent of the health crisis linked to the spread of Covid-19 around the world, have largely contributed to the popularization of this "fashion phenomenon" which wants to be a resistance against the so-called "traditional" modes of consumption. In this context, carpooling is also seen as a resistance to the diktats of official carriers.

this new model, based on the digital services of intermediary providers, was born from the genesis of a spirit of collaborative consumption, the popularization of the use of social networks and comes to compensate for the deficiency of the transport offer during festive periods, or during peak hours, and during exceptional periods (case of health measures dictating restrictions on the mobility of individuals).

The subject of our study concerns the collaborative web platforms (and applications) of carpooling that have developed in recent years in Morocco, offering a new dynamic to the transport sector, and which are an essential tool in the use of collaborative practices. We are interested in this aspect because of the changes it induces at the level of consumption patterns, the transport sector and more broadly at the level of the economy.

Optimizing Shop Replenishment with Product Deterioration over Time

In the current paradigm, which is experiencing a rapid evolution of the retail industry, especially in textile companies, the generic problem of product allocation in a distribution and supply chain consisting of one main warehouse and several locations is a challenge. The in-store replenishment process focuses on dynamically optimising a shop inventory across a wide range of products based on a forecast of sales from previous periods. In this context, the aim of this work is twofold: a) to optimise shop replenishment for products that are not perishable but devalue over time and b) to implement a methodology that combines the benefits of the PSO metaheuristic and Simulated Annealing. This study has been carried out for different periods, shops and product configurations by performing a sensitivity analysis between the way new solutions are updated and the degree of intensification used in local search.

The focus here is on solving the inventory management and in-store replenishment problem for a multi-product model, where products are sold in multiple locations and over various periods of time. The main objective of the problem is profit maximisation, understood as the difference between total revenues and total costs. These total costs include: out-of-stock costs (stock-outs), procurement, transport and storage.

The characteristics of this problem represent an enormous number of feasible combinations. Therefore, the methodology employed seeks the best solution until a stopping criterion is met. Therefore, the longer the simulation time, the better the chance of finding a better solution. The results show that when the generation of a new set of solutions has a strong influence/inferiority to the best solution found so far (weighted average), a higher profit is achieved. On the other hand, this profit is smaller when the solution generated takes into account a greater dependence on randomness. The positive point of randomness
is that it allows a larger number of different neighbourhoods to be tracked.

Marketing Skills in High Demand: 
Exploratory Study of Competencies for a Marketing Professional

The background of our research is the challenge of digital development for marketing: marketing has evolved at an unprecedented rate, which inevitably has created talent gaps and shortcomings in marketing capacity, education, available technology, and implementation. Technological advances, innovative business models, cloud services, big data and many other factors have changed the nature of marketing. In this research we suggest that skills and competencies required in digital marketing pose various types of challenges for marketing education, business and learning marketing profession.

Marketing expertise is a multi-level combination of meta-skills and more technical tooling skills.

Daellenbach (2018) divides marketing skills into four areas: 1) learning and thinking skills, 2) personal interaction and collaboration skills, 3) marketing knowledge and understanding, and 4) technical skills. In his model, skills related to learning, thinking, and collaboration are at the core around which marketing knowledge and technical skills are built. The importance of learning meta-skills is also highlighted. Education should enable and develop an in-depth understanding and growth of meta-skills and technological tooling at an adequate level.

In our research we aim to identify challenges that learners, teachers, and marketing professionals in business face in the rapidly changing environment. We explore marketing learning and especially the challenges from a multifaceted perspective of students, teachers and marketing professionals working in business. Our goal is also to explore and analyze how these talent gaps or challenges could be solved both in educational institutions and in business context.

The research follows qualitative methods both in data collection and analysis. The data consists of 14 open theme interviews with marketing professionals from different industries, 4 in-depth interviews of marketing teachers and 2 focus group interviews with teachers as
well. We have also observational data from classroom environment. The data has been collected in Finland and especially in the context of undergraduate marketing education.

In a preliminary content analysis, we have identified six different challenges that contemporary marketing practices pose in business, marketing education and learning. We describe these challenges as counterparts that represent broad skills needs in marketing profession.

Challenges of marketing education are:

1) Challenges related to the management of professional, specific substantive skills and extensive meta-skills (e.g., interaction, teamwork, self-direction).
2) Competence in the marketing of traditional marketing and the utilization of new, intelligent technology-based marketing.
3) Analytical and on the other hand creative out-of-the-box problem-solving skills.
4) Specific technical expertise and holistic view of a generalist.
5) Quantitative data analysis understanding, and secondly skills based on empathy and emotional intelligence.
6) The ability to apply theoretical knowledge to solve practical problems.

In our research, we refine above mentioned marketing talent gaps and look for innovative solutions to solve these challenges in both work-based learning and in marketing education context.
Teaching Project Management in Higher Education: A Systematic Literature Review and Future Perspectives

There is a growing recognition of the importance of formal project management education, as well as utility of project-based learning across a diverse curriculum. However, despite academic literature supportive of competency-based training and education in how to manage project, programs are fractured or absent from mainstream curriculum. Additionally, science fields tend to overlook business skills altogether. This study performs a Systematic Literature Review to investigate the current state of formal project management education. This review is limited to formal project, program, or portfolio management curricula within institute of higher education. Emergent trends mirror that of project management in industry settings - a lack of cohesion or uniformity in best practices and how to teach them in a variety of settings. To support educators in building curricula, the paper proposes competency-based criteria that should be considered in project management education.
Revealing the Trust-loyalty Relationship in Tourism Local Accommodation: The Pandemic COVID-19 Crisis

The world is facing a global health, social and economic emergency with the COVID-19 pandemic and, as a consequence of this, travel and tourism are among the most affected sectors. In such a context, consumer trust plays a key role in the development and maintenance of long-term relationships between service providers and their clients. Several authors acknowledge that to gain the loyalty of customers, the firm must first gain their trust. We know very little about the effect of COVID19 on these relationships. Therefore, our research addresses the following problem: What factors may influence the perceived trust and loyalty in local accommodation during the COVID-19 pandemic crisis? From this problem, several research questions were formulated, namely: First, to what extent does perceived trust impact customer loyalty? Second, what are the major antecedents of perceived trust in the context of local accommodation during the COVID-19 pandemic? Third, does both the perceived risk and destination perceived value affect the perceived trust and loyalty relationship? The authors administered a survey questionnaire to a sample of 104 tourists. For the analysis of the empirical data collected partial least squares structural equation modelling was used. This study confirms the positive influence of affective evaluation, perceived security, and destination image on perceived trust. It also confirms the impact of perceived trust on both loyalty and destination perceived value. In turn, destination perceived value also influences loyalty. Only local accommodation reputation was found not to influence perceived trust. This article provides a practical contribution to the comprehension of consumer trust antecedents and consumer loyalty in local tourism accommodation during the COVID-19 pandemic crisis. The present pandemic context brings new challenges to marketing professionals such as perceived security and perceived trust and customer loyalty, issues that require more theoretical contributions.
Trade-off between Mass Customization and Choice Overload: An Eye-Tracking Study to Determine the Role of Information Processing in Online Configurations

In addition to other personality dimensions, the need for uniqueness is one of the natural drivers of customers. This leads to a preferential selection of personalized products over mass-produced commodities. To internalize the higher provisions of individualized goods, most of the companies have already established online sales systems also known as mass customization toolkits. The same holds true for most premium automotive companies which offer an online configurator on their websites. However, mass customization is accompanied by the drawback of mass confusion. For example, a typical passenger car from an OEMs can be configured with various engines types, colors, trims, and other options. This results in numerous combinations and possible choices for the customer. When the number of choices and potential combinations reach a certain threshold, the customer gets overwhelmed during the underlying configuration process. Thus, the customer is less satisfied with the choice or loses the motivation to choose resulting in a high abandonment rate during the configuration.

To put this in the theoretical context of choice experiments (CE), those configurations can be described as multi-attribute choice models. On the one hand, CEs explain the influence of product features and the trade-off between attributes of individual choices. But on the other hand, CE neglect to address the question how customers process the underlying information. Therefore, this research project examines the influence of information processing on the participants choice. Eye-tracking is used to explore the visual attention of the participant. In doing so, it may also extant current literature by examining the effect of how “attribute-non-attendance (ANA)” occur by adding the context of the underlying cognitive processes during the decision. Furthermore, it aims to provide a deeper understanding of the occurrence of the choice overload effect in a real-life multi-attribute choice setting and answer the following questions:

How does complexity reduction influence customers information processing/visual attention on multi-attribute choices during online configuration?
How do information processing strategies vary among different customer groups?
How does the information processing vary between different multi-attribute choices of different product attributes (e.g., colors, trims, motorization)?
How does this relate to its subsequent decision outcome?

To answer these questions an eye tracking experiment combined with a substantial survey is conducted. Therefore, a testing environment of the BMW configurator is used with three different levels of complexity, represented in the number of attributes per product category (e.g., color, trims, etc.). The study is tested through a laboratory experiment and a field experiment in the BMW World to capture potential and real customers using a between-subject design. After the data collection ($N_{\text{Survey}} \sim 220$, $N_{\text{Eye-tracking}} \sim 150$ (appropriate data quality)), Areas of interest (AOIs) are created to extract the eye tracking metrics of interest to compare the different eye movement patterns among different product categories (e.g., color, trims). The outstanding combination of an eye-tracking experiment in a laboratory and field setting complemented by the extensive survey is likely to extend beyond experimental choices to represent actual choices in a natural environment.
A Study of Expected Demand and Aggregate Employment in the United States from 1948 to 2021

My paper provides interim results of the empirical portion of my PhD dissertation. I hypothesize that “Firms increase and decrease employment in response to changes in expected demand.”

The paper seeks to answer the question “What are the determinants of changes in aggregate employment in the United States of America [U.S.]?” This is an important research topic because significant increases in unemployment can have a profound effect on the entire society, not just on unemployed workers. When employment declines, public health declines, crime increases, suicides increase, and public revenues decrease. Government is then placed in the unenviable position of facing increased demand for services at the very time that revenue is declining.

During an economic decline, governments can become unstable, and unsavory individuals can rise to positions of power. For example, Adolf Hitler rose to power in Germany in 1929 during the Great Depression. Eberhard Kolb has explained that “The Great Depression provided a political opportunity for Hitler. Germans were ambivalent about the parliamentary republic, which faced challenges from right- and left-wing extremists. The moderate political parties were increasingly unable to stem the tide of extremism, and the German referendum of 1929 helped to elevate Nazi ideology.” (Kolb E. 1988, p. 105).

The paper uses quarterly data from 1948-2021 and estimates the effect of important macroeconomic variables on aggregate employment. The macroeconomic variables will include personal consumption expenditures, U.S. federal government expenditures, nominal GDP, international trade (imports plus exports), M3 money stock, the minimum wage level, nonresidential fixed investment, non-manufacturing employment, and U.S. federal tax receipts.

Financial and Social Implications of DC Pension Funds Aggregation

Defined-contribution pension saving systems are generally harmful to disadvantaged employees who fail to save enough for retirement and pay the highest management fees. In Israel, there are two disadvantaged sectors in the population, Arabs and ultra-Orthodox Jews. This study offers to improve the pension savings of disadvantaged employees by aggregating their pension contributions. The study was conducted based on Israeli data and measures the impact of the aggregation from two perspectives. The social perspective, by reducing poverty and inequality among retirees, and the financial perspective, by reducing government expenditure on support payments. We find that the implementation of the aggregation model proposed in this paper increases the substitution ratio of disadvantaged employees by 32 percent. It reduces the proportions of retirees in the lower-income deciles and raises their proportions in the higher-income deciles. The aggregation is also expected to reduce government expenditure on support payments to retirees by about 63%.

The Role of Integrated Marketing Communications in Creation of Destination Brand Equity during the COVID-19 Pandemic

Integrated Marketing Communications (IMC) have been considered one of the key assets in brand equity building. The IMC approach relies on conveying a clear and consistent message about the brand through different marketing communications tools and channels. In the travel and tourism context, making sure that consumers receive a consistent image of the destination brand is now more important than ever, considering the uncertainties that the COVID-19 pandemic has brought to the sector. On the other hand, destination brand equity has been considered one of the most relevant topics in tourism marketing literature. The concept has been mostly examined through brand awareness, brand image, perceived quality, and brand loyalty. This paper examines the impact of IMC on brand equity of Croatia, a destination that has experienced a remarkable boom this season, regardless of the pandemic. Data collection took place among 333 tourists who visited the country mainly at the beginning of the final quarter of 2021. Findings reveal positive effects of IMC on four destination brand equity dimensions, i.e., brand awareness, brand image, perceived quality, and brand loyalty. The paper has a number of implications for authorities and destination marketing practitioners.

Acknowledgments: This work has been developed under the R+D+I Project GV/2021/176, funded by Generalitat Valenciana, Regional Ministry of Innovation, Universities, Science and Digital Society.
In recent years China’s outward foreign direct investment flows have increased dramatically, and African countries have become important destinations for FDI from China. Even during the pandemic, Chinese FDI to Africa increased by about 10% from 2019 to 2020. However, this raises the question of the impact of this trend on the recipient countries. Taking Ghana – one of the African countries prioritized as a recipient of FDI by China, especially in construction and manufacturing – as a case study, this paper investigates which opportunities and benefits Chinese FDIs entail for Ghana in terms of economic development, poverty alleviation and employment. The impact of Chinese economic engagement in Ghana with respect to raw materials and cash crops is not discussed in this paper. Furthermore, we will analyze threats that are connected to this development. Experiences from Chinese FDI in Europe (as compiled by Brennan and Bakis 2016), with special focus on the labor market, will serve as comparative cases to unveil potential power relations. Characteristics of Southern versus Northern multinational enterprises serve as a theoretical foundation (e.g., Nölke 2014).
Female Labor Supply and International Trade

We study the effect of spatial variation in female labor supply on international trade flows. We identify the set of gender-specific skills and argue that low female labor supply reduces the endowment of female-oriented skills and undermines comparative advantage in industries which use female labor intensively. We confirm this hypothesis using two different settings. First, we show that countries with low female labor supply, measured by female labor force participation, have comparative disadvantage in female-labor-intensive industries. To establish causality, we instrument female labor supply with cross-country differences in cultural values regarding the role of women in society. Second, we confirm the main hypothesis on trade data from Chinese regions. Using spatial variation in sex ratios resulting from the One Child Policy (OCP), we rely on the stringency of OCP as an exogenous female labor supply shifter. Other things equal, regions with higher female population share specialize in industries which use female labor intensively. We interpret our results as highlighting the importance of labor force gender composition for industry’s productivity. Our results imply that the effect of gender imbalances in labor supply on labor market outcomes, observed in many parts of the world, can be mitigated through international trade by utilizing relatively abundant type of labor in export-oriented industries.
Economic Impacts of the Free Trade Agreement between the European Union and Colombia

During the first decades of the twenty first century the European Union (EU) has been the second preferred destination of Colombian exports and the third country of origin of Colombian imports, this confirms that the EU is one of the most important trade partners of Colombia. Nevertheless, in the seven-years post-agreement period, show an uneven performance of bilateral trade between the EU and Colombia. The EU-Colombia FTA was signed on June 26th 2012 and entered into force on 1 March of 2013. It is a plurilateral and intra-regional trade agreement where the developed region is represented by the EU-28 countries and the developing country is represented by Colombia. Considering the theories and methods of regional integration and free trade agreements, the main purpose of this paper is to provide an answer to the next question: ‘How is corruption, flawed democracies and low deep negotiations of free trade agreements related with low performance of free trade agreements and unequal distribution of the benefits of free trade?’. Many scholars currently have developed several methods for ex-ante and ex-post economic evaluation of FTAs in order to understand the trade effects of economic liberalisation and free trade. However, these models do not pay attention to the social impacts of an FTA, for example, the impacts on labour rights and sustainable development. Therefore, taking into consideration that the agreement already entered into force, it is not possible to develop an ex-ante economic evaluation. It is important to take into account that the major part of the theoretical and empirical modelling for assessing the impacts of free trade agreements (FTAs) was produced in the context of developed countries. Consequently, this research implements an ex-post economic evaluation founded in a multidisciplinary methodological approach that includes the qualitative analysis proposed by Jacob Viner and additional methods such as the horizontal depth analysis of the free trade agreement and the analysis of several trade indexes. The methodology and data for developing a multidisciplinary approach is presented in the fourth chapter. This study is based on data from United Nations Commodity Trade Statistics Database (UNSD-COMTRADE). WITS, include several databases provided by partner international organizations and other sources such as the UNCTAD Trade Analysis and Information System.
(TRAiNS) and the World Trade Organization’s integrated database (IDB – WTO) and consolidated tariff schedule (CTS-WTO). This research uses disaggregated data from the World Bank COMTRADE data-base. The figures used in the simulations are for the year 2019 and are based on the harmonized system at the six-digit level. The main conclusions show that despite the EU and Colombia FTA is a relatively high depth agreement, the legal enforceability of social provisions is quite weak into the agreement affecting the implementation of the labour provisions and the achievement of trade and social ambitions. The conclusions also illustrate that expected effects of the FTA implementation are different between developed and developing countries meaning that it is not easy for developing countries such as Colombia to exploit the benefits of FTAs. This research shows that due the persistent development gaps, developing economies with flawed democracies, complex internal conflicts and low level of trade openness cannot exploit the benefits of an FTA in the same way as developed countries do.

Professor Emeritus, Auburn University, USA

Some Empirical Evidence on Comparative Advantage and Net Exports

The present paper examines relative unit labor inputs and net exports in models with three, four, and five regions and products aggregated from the World Input-Output Database. The relative inputs rank the comparative advantage for each pair of products. The approach is to assume the terms of trade most consistent with observed net exports. The trade patterns predicted across seven different aggregations include multiple exports and two-way trade. Model predictions prove largely consistent with net exports supporting the original insight of Ricardo on the importance of relative prices to trade.
Existence and Boundary Behavior of Positive Solutions for a Coupled Fractional System

We consider the following semi-linear fractional system

\[
D^\alpha u = p(t)u^a v^r, \quad \text{in } (0,1),
\]

\[
D^\beta v = q(t)u^s v^b, \quad \text{in } (0,1),
\]

\[
\lim_{t \to 0^+} t^{1-\alpha} u(t) = \lim_{t \to 0^+} t^{1-\beta} v(t) = 0,
\]

where \(\alpha, \beta \in (0,1), \ a, b \in (-1,1)\) and \(r, s \in \mathbb{R}\) such that \((1 - |a|)(1 - |b|) - |rs| > 0\).

\(D^\alpha, D^\beta\) are the Riemann-Liouville fractional derivatives of orders \(\alpha, \beta\) and the nonlinearities \(p, q\) are positive measurable functions on \((0,1)\). Applying the Schauder fixed point theorem, we establish the existence and the boundary behavior of positive solutions in the space of weighted continuous functions.
Teaching, Research, and Service as Drivers of Academic Career Success

Teaching, research, and service is the triad most commonly used to describe the content of academic jobs. To attain professional success, faculty must strike some form of balance among all three aspects of the job. And while the mission of the institution might weigh teaching, research, and service differently, faculty are still expected to deliver exceptional instruction, engage in professional service, and maintain a serious commitment to scholarly work.

Critics assert that the balance between the areas of academic jobs is a mere aspirational goal that contrasts with a long-lasting culture that over glorifies research and pinpoints faculty with notable research productivity as models to be emulated. In response to this, numerous initiatives have attempted to counter any disproportionate attention that research has gained and thus, restore some form of balance between the distinct aspects of academic jobs. As the number of initiatives to restore the balance intensifies, the time is ripe to evaluate if such efforts have impacted business faculty careers. We ask, to what extent the professional success of faculty is driven by a more pluralistic, less research centric, view of careers?

In this study, we rely on career success as criterion for observing how higher education, business schools in our case, validate, via extrinsic incentives (e.g., salary), faculty dedication to teaching, research, and service. We also approach career success as a means to examine if faculty are intrinsically gratified (i.e., subjective career success) by their dedication to the distinct aspects of their jobs. To avoid a skewed view of academe, our study spans to business faculty from a wide array of institutions (i.e., research intensive and teaching-research balanced). Specifically, we examine the impact of proficiency in the three main areas of academic jobs – teaching, research, and service – on objective (e.g., salary) and subjective (i.e., satisfaction) indicators of academic career success.

Results from a sample (N=182) of tenure-track faculty working for business schools in the U.S. reveal that research proficiency is the only aspect of academic jobs that accounts for objective indicators of career. We also found that career length explains subjective career success with none of the three areas of academic jobs directly impacting this criterion. However, we found that research proficiency moderates the
impact of career length on subjective career success. Findings indicate that efforts to elevate the role of teaching and service for professional success in academe are falling short and that the so-called research-centric culture in business schools is more prevalent than expected. We discuss our findings in the context of career theories and interpret their practical implications for the viability of business schools.

Advancing Work- And Family- Associated Outcomes for Employees of Small and Medium Enterprises in Hong Kong: A Study on Workplace Supervisor Support with Smartphone-Based and Capacity-Building Interventions

Dual-income families are becoming very common in post-industrial cities such as Hong Kong. This, however, causes tension between working parents due to demands for resources from two competing domains: work and family. The local working population reported work-family conflicts between their jobs and family caring. Their work is not only limited to their work-related tasks but also their physical ability to care for children and do household chores, bringing a negative impact on their emotions when they are back home. Providing family-friendly programs (FFPs) is thus a crucial policy in modern-day human resource management for reducing work-family conflicts.

Empirical studies highlight how supervisor support for subordinates’ work-life balance (i.e. supervisor flexibility and supervisor sensitivity) is directly associated with lower levels of work-family interference; and how workplace interventions (e.g., alternative work arrangements; perceived flexibility) have to be implemented alongside supervisor support to achieve desired outcomes. A family-supportive work environment features family-supportive policies and supervisors. It encourages organizational efforts towards balancing work and family responsibilities. Therefore, in reducing family-work conflict, the supervisors are key targets for interventions.

However, most relevant studies focus on the United States; there is none yet in Asian perspectives. Likewise, almost none of these studies have capitalized the benefits of big data and communication technology to enable efficient data collection, real-time analysis and effective stakeholder interaction. Using a cluster-randomized experiment design and a process of smartphone application development, this study evaluates the impact of supervisor training interventions on their subordinates’ job- and family-related outcomes in small and medium enterprises (SMEs) based in Hong Kong using ecological momentary assessment.

The study undertakes a 4-month randomized controlled trial intervention. Using a 2x2 factorial design, 320 supervisors randomly
clustered into four groups: 1) no intervention; 2) receiving family-supportive-supervisor training; 3) receiving creativity-training for supervisors; and 4) receiving both interventions. The study assesses the impact of supervisor training and supervisor creativity intervention program on job- and family-related outcomes through mediating effect of family-supportive supervisor behaviours. The creativity of the supervisor is crucial in his/ her customisation of a FFPs that resolves conflicts between work and non-work/ family issues.

This analysis adopts the job-demands-resources model (Bakker et al., 2003; Demerouti et al., 2001) and the social exchange theory (Bagger & Li, 2014). It examines the mediating role of (a) quality of perceived exchange relationship, (b) social exchange between the supervisor and the subordinate, (c) social norm regarding the utilization of family-friendly policies, and (d) work-life-balance or conflict in the link between family-supportive supervisor behaviours and job-related outcomes. The results of this study will serve as the foundation for HR policy development in Hong Kong regarding family-friendly employment practices in order to further improve the employees’ work-life balance.

Crossing the Chasm:
The Case of Taiwan’s Electric Scooters

Because of their mobility and affordability, motorcycles are a primary mode of urban transportation worldwide, especially in emerging countries. However, the noxious exhaust emitted by motorcycles harms human health and contributes to global warming; thus, a timely transition to non-emission green transportation is urgently required to create a health-friendly environment and mitigate climate change. Electric scooters, which do not release emissions, are an ideal solution for urban transportation challenges. The first battery-powered motorcycle was introduced in Taiwan in 1968. However, despite efforts by the Taiwan government and the industry to promote and grow this market for more than half a century, the market only experienced substantial growth in recent years. Electric scooter sales grew considerably from dozens of units a month before 2015 to more than 10,000 units a month in 2019, at which point electric scooters accounted for 18% of the overall motorcycle market (comprising both battery and fuel-powered motorcycles) in Taiwan, suggesting that the chasm of adoption of electric scooters has been crossed. To explore the main factors that influence the success of the electric scooter industry in Taiwan, the present study investigated the evolution of Taiwan’s electric scooter industry and examined the business models that were applied in the market. To clarify the dynamics of market development, the present study also conducted a content analysis to analyze 5,366 news reports on electric scooters that were published between 1968 and 2019 in Taiwan. In-depth semi-structured interviews with industry experts were conducted to verify the content analysis results and acquire additional information that were not revealed by news reports. The research results indicated that the monetary incentives offered by the Taiwan government to potential electric scooter purchasers did not trigger the decisive growth of the electric scooter market. By contrast, the innovative battery-swap business model successfully addressed the mileage limit problem of electric scooters and eliminated the inconveniences associated with battery charging, which previously hindered the adoption of electric scooters. The streamlined designs and high-end technological features (e.g., Internet of Things technologies) of new-generation electric scooters attracted numerous adopters despite the high launch prices of these scooters. The establishment of a battery-
swap ecosystem further expanded the electric scooter market. Several brands have collaborated to provide more product options for a wider range of budgets. Notably, perception of environmental protection did not influence the adoption of electric scooters in Taiwan. This study contributes to extend the research of crossing the chasm pioneered by Geoffrey A. Moore to bridge not only the literature gap to demonstrate how the chasm is crossed by government-led public policy but also, more importantly, empirically verified how firm-led innovative business process is imperative in alliance with the public policy.

FDI Flows and the Effects of the Shadow Economy:  
Evidence from Gravity Modelling

This paper will explore the questions if and what the effects of the size of shadow economy on FDI flows are. For this, two different datasets are used: one is an OECD-only dataset that allows for bilateral, bidirectional FDI flow data for the years 1992 - 2017 and the other is a dataset that has outward FDI flows from OECD origin countries into 158 target countries for the year 2010 - 2018. To analyze the datasets both fixed effects as well as dyadic fixed effects gravity models are used. Preliminary results suggest, for the OECD-only sample, a positive effect of the shadow economy on FDI flows for target countries and a negative effect for origin countries. This could suggest, that in the OECD only sample, there are benefits that can be gained for companies when investing in countries with a bigger shadow economy that outweigh the associated risks. For outward FDI flows from OECD countries (Dataset 2), early findings suggest that the size of the shadow economy has a negative effect on FDI flows for the target countries. This could suggest that there is a tipping point in the size of the shadow economy as for OECD countries the shadow economy is fairly small when compared to other non-OECD countries. If that tipping point is exceeded it turns the effect of the shadow economy from a positive into a negative, suggesting that the risk of investing in a country with a bigger shadow economy is too high and does outweigh the benefits significantly.
The Perceived Importance of Factors Affecting the Risks and Benefits of Cloud Computing: A Managers’ Perspective

The demand for cloud computing services has grown dramatically during the last decade. According to a study undertaken by MarketsandMarkets.com (2021) the global cloud computing market size is expected to grow from USD 445.3 billion in 2022 to USD 957.3 billion by 2026. This growth will also accelerate as the work from home (WFH) initiatives take route worldwide partly fueled by the COVID-29 pandemic. In general terms, cloud computing allows business enterprises and government agencies to use the servers of providers of cloud computing services on the internet to store, manage and process both critical and large amounts of data quickly and securely. More specifically, cloud computing provides its users the capacity to store and access large amounts of data (text, video, transactional and social media) quickly, securely and at lower costs than the centralized corporate IT infrastructures. However, as with any new technology, its adoption is fraught with uncertainty and missteps. Unfortunately, there have been many cases where the integration of cloud computing has produced more problems than benefits. Undeniably, the introduction of cloud computing can be very disruptive and costly to the organization and this ensuing uncertainty has generated mixed reactions and attitudes towards cloud computing among both IT and corporate managers. In addition, the spate of highly publicized major intrusions in cloud servers recently has infused increased skepticism in the minds of managers as to the benefits of cloud computing. Given the vital importance of cloud computing to both corporate and governmental organization and the mixed attitudes towards it, the authors undertook a survey to understand better this very complex issue. To shed light on managers’ attitudes towards cloud computing, a questionnaire administered through SurveyMonkey was sent to a convenience sample of one thousand managers in different corporate positions and in
different countries. Two hundred and twenty-five respondents returned the questionnaire for a response rate of 22.9%. Managers’ perception and attitudes towards cloud computing were measured by obtaining their assessment of the global organizational risk cloud competing represented for them on a scale of 100 points where zero represented very low risk and one hundred very high risk. To obtain a more in-depth perspective of their assessment, the responding managers provided their perceived importance of thirty-five specific areas of major risk on a five-point rating scale where 1 was not all important and 5 of highest importance. A component analysis of the thirty-five risk areas generated a six-component structure reproducing sixty five percent on the total variance. The first component named ‘data and operational security’ dominates the structure with 41.18% of the total variance explained. To determine the relative importance of the thirty-five risk areas, a multiple discriminant analysis was performed on the regrouped variable, ‘global organizational risk of cloud computing’. The dependent variable represented the overall risk assessment grouped into three levels, low, moderate and high risk. Two statistically significant discriminant functions were identified with an overall correct classification rate of 68%. The study provides very useful insights into the complex dynamics of the major elements that influence managers’ perceptions of the inherent risks of pursuing cloud computing strategies, the links between the perception of these risks and the general attitudes towards cloud computing.
